## Notes on the function gsw\_sigma0\_CT\_exact(SA,CT)

Potential density anomaly  $\sigma^{\Theta}$  is defined by Eqn. (3.6.1) of IOC *et al.* (2010), namely

$$\sigma^{\Theta}(S_{A}, t, p, p_{r}) = \rho^{\Theta}(S_{A}, t, p, p_{r}) - 1000 \text{ kg m}^{-3}$$
$$= \hat{\rho}(S_{A}, \Theta, p_{r}) - 1000 \text{ kg m}^{-3}.$$
(1)

The present function,  $gsw\_sigma0\_CT\_exact(SA,CT)$ , calculates potential density with a reference pressure of 0 dbar, and uses the full TEOS-10 Gibbs function  $g(S_A,t,p)$  of IOC *et al.* (2010), being the sum of the IAPWS-09 and IAPWS-08 Gibbs functions.

This function is simply two calls to other GSW functions, as follows,

```
pr0 = zeros(size(SA));
pt = gsw_pt_from_CT(SA,CT);
sigma0_CT_exact = gsw_rho_t_exact(SA,pt,pr0) - 1000;
```

## 3.6 Potential density anomaly

Potential density anomaly,  $\sigma^{\theta}$  or  $\sigma^{\Theta}$ , is simply potential density minus 1000 kg m<sup>-3</sup>,

$$\sigma^{\theta}(S_{A}, t, p, p_{r}) = \sigma^{\Theta}(S_{A}, t, p, p_{r}) = \rho^{\theta}(S_{A}, t, p, p_{r}) - 1000 \text{ kg m}^{-3}$$

$$= \rho^{\Theta}(S_{A}, t, p, p_{r}) - 1000 \text{ kg m}^{-3}$$

$$= g_{P}^{-1}(S_{A}, \theta[S_{A}, t, p, p_{r}], p_{r}) - 1000 \text{ kg m}^{-3}.$$
(3.6.1)

Note that it is equally correct to label potential density anomaly as  $\sigma^{\theta}$  or  $\sigma^{\Theta}$  because both  $\theta$  and  $\Theta$  are constant during the isentropic and isohaline pressure change from p to  $p_r$ .
